

Guide for Human Evaluation of Labeling Process

Overview

You will evaluate the quality of automatically generated labels for an Indonesian Question Answering dataset. The labels (A, B, C) classify questions based on their retrieval complexity.

Your Role

As a native Indonesian speaker, you will assess whether the automatically assigned labels are appropriate and accurate for each question.

What You Need to Do

1. Review 150 Questions (50 per class)

- Each question has been automatically labeled as Class A, B, or C
- You will determine if the label is correct based on the question's complexity

2. Label Class Definitions

Class A (Simple Retrieval)

- Single fact answer
- Direct question-answer mapping
- Example: "Siapa presiden pertama Indonesia?"
- Expected: Answer directly available in one context passage

Class B (Multi-hop Simple)

- Requires 2-3 reasoning steps
- Multiple related facts needed
- Example: "Siapa presiden yang menandatangani kemerdekaan Indonesia dan kapan itu terjadi?"
- Expected: Multiple retrievals needed but straightforward chain

Class C (Complex Multi-hop)

- Requires 4+ reasoning steps
- Involves bridging entities, comparisons, or complex inference
- Example: "Di antara presiden Indonesia, siapa yang memiliki masa jabatan terpanjang dan berapa lama?"
- Expected: Multi-step reasoning with entity connections

3. For Each Question, Evaluate:

a) Label Correctness

- ✓ Correct: The automated label matches your judgment
- ✗ Incorrect: The question belongs to a different class
- ? Ambiguous: The question could reasonably fit multiple classes

b) Justification (Briefly explain your reasoning)

- Why is this label correct/incorrect?
- What aspects make it simple or complex?

4. Evaluation Process

Step 1: Read the question in Indonesian **Step 2:** Consider what's needed to answer it **Step 3:** Determine the appropriate class (A/B/C) **Step 4:** Compare with the automated label **Step 5:** Mark Correct/Incorrect/Ambiguous **Step 6:** Add brief justification

5. Example Evaluation

Question: "Apa ibu kota Indonesia?" **Automated Label:** A

Your Evaluation:

- Label Correctness: ✓ Correct
 - Justification: This is a simple factual question requiring one piece of information directly available in a single context passage.
-

Question: "Siapa penemu bola lampu dan kapan itu terjadi?" **Automated Label:** B

Your Evaluation:

- Label Correctness: ✓ Correct
 - Justification: Requires two pieces of information (who and when) but they're directly related and straightforward to retrieve.
-

Question: "Di antara presiden Indonesia, siapa yang memiliki masa jabatan terpanjang dan berapa lama, serta bagaimana ini dibandingkan dengan presiden lainnya?"
Automated Label: C

Your Evaluation:

- ✗ Incorrect (Should be B)
- Justification: While it mentions comparison, the core question is straightforward - find the longest-serving president. The comparison is secondary and doesn't require complex bridging reasoning.

6. Important Guidelines

- **Trust your native intuition:** If a question feels complex, it probably is
- **Focus on retrieval needs:** What would a system need to look up to answer this?
- **Be consistent:** Apply the same criteria across all questions
- **Note ambiguity:** Mark unclear cases separately
- **Consider real-world QA:** What would a human need to search for?

7. What Not to Do

- ⚠ Don't judge the translation quality (that's a separate evaluation)
- ⚠ Don't evaluate the answer quality (we're only checking labels)
- ⚠ Don't overthink - trust your first instinct
- ⚠ Don't spend more than 1-2 minutes per question

8. Format Your Response

For each question, provide:

```
Question: [text]
Automated Label: [A/B/C]
Your Label: [A/B/C]
Correctness: [✓ Correct / ✗ Incorrect / ? Ambiguous]
Justification: [1-2 sentences]
```

9. Completion Checklist

- ☐ Evaluated all 150 questions
- ☐ Provided label for each question
- ☐ Added justification for each evaluation
- ☐ Flagged ambiguous cases
- ☐ Noted any patterns in misclassifications

If there are any further questions, please ask first!
